

# FACTORIZATION HOMOLOGY OF ENRICHED $\infty$ -CATEGORIES

DAVID AYALA, AARON MAZEL-GEE, AND NICK ROZENBLYUM

ABSTRACT. I am interested in Stratifications in general. There does not seem to be an exceeding amount of literature on the subject, so I am interested in compiling notes on the subject as I learn. The hope is to compile notes on stratifications of topological spaces, conical stratifications, and stratifications of stable infinity categories.

## CONTENTS

0. Stratifications	1
0.1. Posets	1
0.2. Posets as Categories	1

## 0. STRATIFICATIONS

### 0.1. Posets.

**Definition 0.1.1** (Posets). A poset is

- + ) A set  $P$
- + ) A binary relation  $\leq$

such that the binary relation satisfies the following properties. Let

- ) (Reflexive)- $p \leq p$
- ) (Antisymmetry)-If  $p \leq p'$  and  $p' \leq p$ , then  $p = p'$
- ) (Transitive)- $p \leq p'$  and  $p' \leq p''$  then  $p \leq p''$

**Example 0.1.2.** The most basic example of a poset is a finite set, with a linear ordering. A linear ordering is a binary operation such that for all  $p$  and  $p'$  in  $P$ , either  $p \leq p'$  or  $p' \leq p$ . Since every set is isomorphic to a set  $\{0, \dots, n\}$ , we defined the following poset  $[n]$ , which gives the usual ordering to the set  $\{0, \dots, n\}$

$$[n] := \{0 \leq \dots \leq n\}$$

**Definition 0.1.3.** A map between posets  $P$  and  $P'$

- + ) A map  $f : P \rightarrow P'$

such that

---

-) The map  $f$  induces a map on the binary relation  $\leq_P$  to  $\leq_{P'}$

## 0.2. Posets as Categories.

**Definition 0.2.1** (Poset). A poset is

+) A category  $\mathbf{P}$

such that

-) Either  $\text{Hom}(p, p') = \emptyset$  or  $\text{Hom}(p, p') \simeq *$

-) If  $\text{Hom}(p, p') = *$  and  $\text{Hom}(p', p) \simeq *$  then  $p = p'$

**Remark 0.2.2.** The transitive condition of a poset  $\mathbf{P}$  is the condition that there is a composition rule for the category, namely if  $\text{Hom}(p, p') \simeq \text{Hom}(p', p'') \simeq *$ , then it must be the case that  $\text{Hom}(p, p'') \simeq *$ .
